BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>Basic definitions</h2> <ul style="list-style-type: none"> • A procedure is an act that leads to a result. For example, <ul style="list-style-type: none"> ◦ throwing a dice ◦ visiting a website. • An event is a collection of the outcomes of a procedure, such as <ul style="list-style-type: none"> ◦ getting a heads on a coin flip ◦ leaving a website after only 4 seconds. • A simple event is an outcome/event of a procedure that cannot be broken down further. <ul style="list-style-type: none"> ◦ For example, rolling two dice can be broken down into two simple events: rolling die 1 and rolling die 2. • The sample space of a procedure is the set of all possible simple events. For example, an experiment is performed, in which a coin is flipped three times in succession. <ul style="list-style-type: none"> ◦ What is the size of the sample space for this experiment? ◦ The answer is eight, because the results could be any one of the possibilities in the following sample space—{HHH, HHT, HTT, HTH, TTT, TTH, THH, or THT}.

<h2>Probability</h2> <ul style="list-style-type: none"> The probability of an event represents the frequency, or chance, that the event will happen. For notation, if A is an event, P(A) is the probability of the occurrence of the event. We can define the actual probability of an event, A, as follows: $P(A) = \frac{\text{number of ways A occur}}{\text{size of sample space}}$ Here, A is the event in question. Think of an entire universe of events where anything is possible, and let's represent it as a circle. We can think of a single event, A, as being a smaller circle within that larger universe, as shown in the following diagram: 					
CH 5 : INTRODUCTION TO PROBABILITY		BY DR. SALHA ALZHRANI			6

BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>Probability</h2> <ul style="list-style-type: none"> The maximum probability of any event is 1. This can be understood as the red circle grows so large that it is the size of the universe (the larger circle). Example 1: Let's now pretend that our universe involves a research study on humans, and the A event is people in that study who have cancer. If our study has 100 people and A has 25 people, the probability of A or $P(A)$ is 25/100. Example 2: Let's say we have two coins and we want the probability that we will roll two heads. First, let's define A. It is the event in which two heads occur. The number of ways that A can occur is 1. Second, The sample space of the experiment is $\{HH, HT, TH, TT\}$, where each two-letter word indicates the outcome of the first and second coin simultaneously. The size of the sample space is four. So, $P(\text{getting two heads}) = 1/4$.

BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>Bayesian versus Frequentist</h2> <ul style="list-style-type: none"> In a Frequentist approach, the probability of an event is calculated through <u>experimentation</u>. It uses the past in order to predict the future chance of an event. The basic formula is as follows: $P(A) = \frac{\text{number of times A occurred}}{\text{number of times the procedure was repeated}}$ Basically, we observe several instances of the event and count the number of times <i>A</i> was satisfied. The division of these numbers is an approximation of the probability. The Bayesian approach differs by dictating that probabilities must be discerned using <u>theoretical means</u>. Using the Bayes approach, we would have to think a bit more critically about events and why they occur. The relative frequency of an event is how often an event occurs divided by the total number of observations.

BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>Compound events</h2> <ul style="list-style-type: none"> Sometimes, we need to deal with two or more events. These are called compound events. A compound event is any event that combines two or more simple events. When this happens, we need some special notation. Given events A and B: <ul style="list-style-type: none"> The probability that A and B occur is $P(A \cap B) = P(A \text{ and } B)$ The probability that either A or B occurs is $P(A \cup B) = P(A \text{ or } B)$

BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>Conditional probability</h2> <ul style="list-style-type: none"> A conditional probability of A given B or $P(A B)$, it is asking you to calculate the probability of an event given that another event has already happened. The formula can be given as follows: $P(A B) = P(A \text{ and } B) / P(B)$

 <h2>THE RULES OF PROBABILITY</h2>					
CH 5 : INTRODUCTION TO PROBABILITY		BY DR. SALHA ALZHRANI			14

BASIC DEFINITIONS	PROBABILITY	BAYESIAN VERSUS FREQUENTIST	COMPOUND EVENTS	CONDITIONAL PROBABILITY	THE RULES OF PROBABILITY
<h2>The rules of probability</h2> <ul style="list-style-type: none"> • The addition rule: The addition rule is used to calculate the probability of <i>either or</i> events. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$ • Mutual exclusivity: We say that two events are mutually exclusive if they cannot occur at the same time. This means that $A \cap B = \emptyset$ or just that the <i>intersection</i> of the events is the empty set. $P(A \cup B) = P(A \text{ or } B) = P(A) + P(B) - P(A \cap B) = P(A) + P(B)$ • The multiplication rule: The multiplication rule is used to calculate the probability of <i>and</i> events. $P(A \cap B) = P(A \text{ and } B) = P(A) \cdot P(B A)$ • Independence: Two events are independent if one event <i>does not</i> affect the outcome of the other, that is $P(B A) = P(B)$ and $P(A B) = P(A)$. If two events are independent, then: $P(A \cap B) = P(A) \cdot P(B A) = P(A) \cdot P(B)$ • Complementary events: The complement of A is the <i>opposite</i> or <i>negation</i> of A. $P(\bar{A}) = 1 - P(A)$
